

Oval-shaped planter consisting of two bolted half-shells made from a folded 1.5 mm thick steel sheet mantle welded to a folded 1.5 mm thick steel sheet bottom. At the bottom, a stainless steel overflow screwed to the bottom ensures a water reserve for vegetation. The planter is available in corten steel, which is sandblasted and oxidised, in brushed stainless steel, and in steel. All metal parts are galvanised and coated with thermosetting polyester powder, also two-tone (except for corten steel and stainless steel versions). The parts are mechanically assembled using stainless steel screws and special vertical seals. Simple installation with M10 adjustable feet for levelling.
